THE MONGOOSE.

UNCLE SAM TO IMPORT IT FOR ECONOMIC PURPOSES,

India It Kills Venomous Spents, But Here It Will Devote Its Attention to Gophers and Rats.

be added to the fauna of this country under Govern-ment auspices. It is ment auspices. a small carnivorous mammal, about the size of a big cat, which is native to India. In that part

of the world it does excellent service by killing snakes, to which it has a mortal antipathy, not hesitating to attack even the formidable cobra and almost invariathe formidable cobra and almost invariably winning the fight. Also it is death on rats, and on this account it was imported not long age to the Sandwich Islands. Field rats, the multitudinous progeny of the domestic species run wild, were creating havoc there, and this remedy was sought with very remarkable success, so that the objectionable rodents bid fair to be soon wiped out. In Jamaica likewise the mongoose has been introduced for the same purpose and with equally satisfying results.

So serious has the plague of gophers and certain rodents become to farmers in some parts of the west that the Depart-

some parts of the west that the Department of Agriculture proposes to fetch a few speciments of the mongoose to the United States with a view to exterminat-United States with a view to exterminating the pests. The animal is thoroughly able to earn its own living and is in no way likely to become a charge to any community. It subsists on small and mostly obnoxious mammals, lizards, snakes and occasionally a bird's egg. Entirely susceptible of domestication, it is warranted to keep howes effect of rest. warranted to keep houses clear of rats. What it has done for the sugar fields of the Hawaiian Islands it is expected to do for the grain crops in the wheat belt and elsewhere. The mongoose has never been known to be harmful in any way, by kill ing chickens or otherwise, and no dam age is likely to result if it should multiply great on this side of the water.

great on this side of the water.
So much cancot be said of so many other animals which have been introduced in this country with the expectation that they would prove desirable. A while ago some people in Oregon thought that it would be an excellent thing to bring thither the Chinese pheasant. Six species were brought ages and calculated the species were brought ages and calculated. species were brought over and colonies of them were established on Protection Island in Puget Sound, on Vancouver Island, and at the junction of the Williamette River with the Columbia. The were imported from China by ex-Minis ter Denny and were taken care of, fed and guarded from sports-men. Four of the six kinds—the "gol-

den," the "green," the "ring," and the "silver"—survived and have spread all over the Willamette valley, which is the most fertile in the world. Already they have begun to do much damage and the farmers are seriously complaining of them. They multiply at an enormous rate, each female producing two or three broods a season of from fifteen to eighteen each. The cocks are very courageous, and will fight anything. They go into the barnyards and thrash the best roosters. It is even reported that they sometimes walk away with the that they sometimes walk away with the that they sometimes want away with the hens. Their favorite haunts are low grounds near grain fields, which they at-tack, destroying gardens also. People often find their nests in old straw stacks hens. and stubble fields, taking the eggs and raising them under brooding do-mestic fowls. The males weigh about

five pounds each.

The trouble is that an exotic animal The trouble is that an exotic animal, upon being introduced, usually finds itself in a situation of great advantage for multiplying. It has left all its old enemies behind it, and those creatures which might attack it in its new environment require some time to "get on to" it, so to speak. Thus the crows in Oregon have only just begun to prey upon the eggs of the pheasants, having ascertained the nesting habits of the lat-ter. Inasmuch as nature always makes allowance for destruction by foes in

THE GOPHER. providing for the propagation of any beast or bird, the fresh immigrant is apt to multiply enormously and to become a nuisance. Generally speaking, such experiments are dangerous as are being tried by an acclimatization society in Portland, Ore., which has within the last few years brought over from Europe and let Ore., which has within the last few years brought over from Europe and let loose thousands of birds in the valleys of that State—among others the nightingale, the song thrush, the European yellowhammer and the English black bird, which is closely allied to and very much like our robin. These birds were caught by professional bird catchers in Germany and England and sent across the ocean in stages, supplied with seed and cuttlebones. Skylarks and starlings have been imported similarly, colonies of both being established on Long Island, where they were wiped out by the great blizzard. So far as the starlings were concerned, this was probably

the great blizzard. So far as the star-lings were concerned, this was probably fortunate, because they are voracious grain feeders and would have been likely to prove most detrimental.

The story of the so-called English sparrow in America is a sufficiently fa-miliar one. In Australia, also, where it was introduced, it has been doing millions of dollars' worth of damage yearly, and not long ago the main issue

in the elections there was drawn between the "sparrow" and the "anti-sparrow" men, all politics being made subordinate to the question whether the Government to the question whether the Government should undertake the extirpation of the bird. At present in the land of the kan-garoo organized efforts to this end are being made, one of the most effective being to carry a sack of poisoned grain with a small hole in it at the tail-board of a wargen travelling over the peads and with a small hole in it at the tail-board of a wagon, traveling over the roads and leaving for mile after mile a continuous dribble. Men also go about with long poles bearing hooks, with which they pull down the nests. One person in this manner can distroy hundreds of thousands of eggs and young in a single season. Nevertheless, but little impressiod seems to have been made thus far upon their numbers.

The injury done to Australia by the imprudence of acclimatization societies

The injury done to Australia by the imprudence of acclimatization societies can only be estimated in thousands of millions of dollars. Rabbits, introduced from England for purposes of sport, have laid waste the country, destroying the crops and almost annihilating the sheep farming industry. Poisoning and shooting, the artificial propagation of diseases among them, wholesale canning of rabbit meat and the exportation of skins and furs have had small effect in diminishing their numbers. Ferrets, introduced to attack them, have in their turn proved a nuisance, devouring the introduced to attack them, have in their turn proved a nuisance, devouring the farmers chickens. In like manner the own imported to gobble the sparrows have exhibited a preference for the meat of domestic fowls. Foxes, brought across the seas by sportsmen, have multiplied greatly and are proving a bane. Even bumble bees, fetched for the purpose of fertilizing clover, which depends Even bumble bees, fetched for the pur-pose of fertilizing clover, which depends upon their agency in this regard, threaten to become so numerous as to consume all the honey which the honey bees would otherwise have an opportunity to collect. Taking all these things into view the Government of the United States is in-clined to disapprove of the importation into this country of domestic animals without its own authoristic superior

into this country of domestic animals without its own authoritative superintendence. Uncle Sam will fetch the mongoose and will keep an eye upon it for a while, so that, if it should prove obnoxious, it can be promptly exterminated by concerted measures. Recently the Department of Agriculture has gone to some actant into the husiness of year. to some extent into the business of pro-curing parasites from abroad to feed upon and thus destroy other bugs which upon and thus destroy other bugs which are harmful. The most notable case of this was the introduction of the "vedalia" bug from Australia, which has saved the orange industry of California by preying on the scale insect that threatened to wipe out orange culture altogether in that State. In the nature of things it is impossible to avoid the importation of many objectionable portation of many objectionable creatures through accident. By such means rats and mice were brought to America. Similarly, pestiferous insects America. Similarly, positierous insects come over in the shape of cocoons and eggs attached to cittings and seedlings of plants, and pretty nearly all of the most injurious foreign weeds have been introduced in like manner to our soil.—

The Khedivess of Egypt. Contrary to the custom of his fathers, the late Khedive Tewilk, of Egypt, left but one widow. She was a princess of royal blood, her mother being a daugh-ter of the Sultan of Turkey and her father having been Viceroy of Egypt.

THE KHEDIVESS OF EGYPT

The Khedivess dowager is still a beautiful woman with a magnificent com-plexion, brown eyes, and hair of a red-lish tinge. Notwithstanding her power over him, she never attempted to assist the late Khedive in the affairs of the na

the late Khedive in the affairs of the nation, confining herself strictly to social and domestic duties.

She adores her son Abbas, the present ruler, even as she did his father, and it is unlikely that she will try to give him any unasked aid in doing all that England suggests—which seems to be the chief duty of an Egyptian ruler.

Nature's First Law.

"A place for everything and everything in its place" is an exceedingly good rule to follow. Let husband and children realize that. Though the hall children realize that. Though the hall stand is the place for the hats of the men of the household, it is a most unsightly object when loaded down with coats, cloaks, rubbers, etc. If there is a closet in the hall it is just as easy to put away the outer garments where they will not greet the eye of every visitor and reserve the hat rack for the hats of the casual callers. Scrap baskets placed in every room will save a world of litter if put to their proper use. These baskets can be emptied each morning, the car-pet sweeper run over the floor and the can be emptied each morning, the carpet sweeper run over the floor and the room, when dusted, will look as weat as a pin." If books are taken from the library make it an infallible rule that they shall be returned when the reader has finished with them. Have the shades at the window even, the table set with precision and care, the children neat and clean, and you may be sure the husband and father will appreciate your efforts. Many women, excellent house-keepers, too, do all this, but never have time for anything else.—Home and time for anything else. - Home and

Value of Commissions.

Previous to July, 1871, when the system was abolished, a commission in the British army could be purchased at the following prices: Cornet or ensign, £470; lieutenant, £700; captain, £1,800; major, £3,200; lieutenant colonel, £4,500.

WORDS OF WISDOM.

Our heaviest burdens are those we Where there is no faith there is no

Much doing is not so important as well doing.

Genius may be swift, but patience has the surest feet. A self-made man never gets tired of bragging on his job.

More people fall from discouragement than from misfortune.

If groaning could heat broken bones, obody would be lame. No man can look at the stars without wanting to live forever.

If nobody had a hobby the world would soon stop moving. There would be more good boys if there were more good fathers.

Love never has to be watched to see that it does a full day's work. Living only for what we can see, proves that we are short-sighted.

The man who loves most is not the one who tries to keep the most. Admiration is well enough in its way, but it can never do the work of love.

A fauntic is a man who takes a burning interest in something we don't like. The greatest blockhead is the one

nistakes never teach him any-It is a great deal easier to be contented without riches than it with them.— Indianapolis (Ind.) Ram's Horn.

A Famous Old Argonant Judge.

Judge Rearden described the morning appearance of the late Judge Lake when he sat upon the bench. It seems that Judge Lake used to be a sort of Judge Jeffreys toward criminals and that his mercy was never strained. For in-stance, he would walk up the steps of the "bench," and the poor murdering or thieving criminal below would shiver and think of cells and gallows. "Pat," would the Judge say sharply, "heat the stove!"

Then the faithful menial would stir the fire hurriedly, and the Judge would adjust his shining collar and faultless neckcloth.

After which he would rub his polished finger-nails together and thrust them through a page or two of the decisions of that famous British jurist, Lord Erskine, and as a climax he would look at his translucent hands and exclaim:

at his translucent hands and exclaim:

"Hurry them up—I've only a few minutes this morning."

Then the batch of prisoners would be ushered into the dock and the steely eyes of the Judge would be turned upon them in such a fashion that, like certain pictures painted by the old masters, one might imagine that the eyes looked a dozen ways at once.

Lake seems to have been so impartial that he lacked discrimination, for on a certain occasion, when the clerk called off the first name on the docket, a gray-bearded burglar of sixty-eight years stepped forward to be sentenced.

stepped forward to be sentenced.
"Prisoner at the bar," said the Judge, inspecting his elegant little finger-nail, "you have been before this court on the

inspecting his clegant little finger-nail,
"you have been before this court on the
charge of theft many times. I hesitate
to be severe, but in justice to public
morals I find it my duty to sentence you
to confinement in State prison for the
term of fifty years, and when you emerge
from its walls may you be a better man!"

"Say, Judge," said the clerk, looking up to the polished jurist, "you got
the wrong man—you forgot—it was
young Hayes you were going to send up
for fifty. The old tramp, there, he ain't
going to last two years, let alone fifty!"

"Ah! how is that?" demanded the
Judge, inspecting the list on his desk—
"Oh, I see—yes, yes!—dear me!—how
very odd! Just give Hayes fifty years
also, and you may as well let the other
matter stand. When a man of sixty odd
years hasn't learned enough to avoid
being found out he's much safer in
jail."

And the docket would proceed.—San

And the docket would proceed .- San

Spontaneous Combustion.

A young man of Parkenburg, W. Va., omploye of an oil company, and whose woolen clothing was saturated with linseed oil and other inflammables, was washing his hands in benzine when his clothing suddenly burst into flame. The other employes extinguished the fire, and he was found to be sericusly burned. His wounds were dressed in cotton waste wounds were dressed in cotton waste saturated with linseed oil, and he was put to bed. Some hours after that the bed caught fire, and he was again badly berred. Dr. Cowden, the attending physician, supposing the fires to originate in spontaneous combustion, proceeded to make some experiments, which he thus describes: The first test was by saturating waste with linseed oil and keeping it at a temperature of 140 degrees; in three hours it began to swelch grees; in three hours it began to smoke, and in a draft ignited. Second test, by rubbing waste containing some paint and the linseed oil on a wooden block for rubong waste containing some paint and the linseed oil on a wooden block for two minutes, then put in oil, both at a temperature of ninety-five degrees (not quite the beat of the human body); it took fire in less than one hour. Linseed oil alone was used on the waste, with the same results. Fourth, linseed oil and waste were kept at ninety-five degrees three and one-half hours, were taken out and tubbed, and soon began to smoke, and in a draft ignited. Those experiments were intended to place the oil and waste as near as possible under the same conditions that they were in the bed of the patient, and at about the same temperature of his body heat. All the experiments brought about chemical oxidation and combustion, and there is reason to believe that the burning and subsequent fire in his bed were from similar causes.—Now Orleans Picayune.

206 Oranges on One Tree.

In the doorway of A. H. Tults, of Pomona, there is a youn corange tree that is a marvel, says the Los Angeles (Cal.) Times. It was a small tree, budded one year when set two years ago—in June, 1889. It is now not a large tree, and the wonder is how it can large tree, and the wonder is how it can support the enormous crop of fruit it has. There are 206 fine large oranges on this tree, and they are coloring like those upon trees bearing but few. It is a Malta blood and made a good growth the first year and a moderate growth this year. In one cluster about the main year. In one cluster about the main stem there are sixteen oranges, and a branch one-half inch through has nine-teen upon it. Could such a tree by shown at the Columbia Exposition what a tide of emigration would be turned to-ward the orange lands of California.

Here It is.

To the man who labors with his hands physical trouble is a very serious thing. It is not merely the pain he endures, racking and tormenting as it is, but the prospective loss of time, money and place haunts him and aggraments of the prospective loss of the money and place haunts him and aggraments of the prospective loss of the property of the propert
